Manually setting the IP-Address

1. Open the DOS control panel on your PC

2. Enter the "ipconfig" command to determine your current network configuration

- 3. Select an IP address for the device by varying the last octet of the IP address of your PC (in the example above, for example, 161 instead of 27)
- 4. Check if the selected address is free

5. When the "ping" command times out, the selected address is probably free and the data shown above can be set in the device

Service 2/3	Netzwerk Einstellungen				
Netzwerk Einstellungen 192.168.123.161	IP-Adresse:	192	168	123	161
Name der Attraktion	Subnetzmaske:	255	255	255	0
Alarm Einstellungen	Gateway:	192	168	123	1
Konfiguration der Hardware	DNS Server:	192	168	123	1
Konfiguration der Abdeckung	LAN-PIN	1234			
K = 14:03 11.04.13 K	< 🛆 i		ок		09:48 15.04.13

6. Thereafter, the device can be reached with the web browser under the set IP address
